First observation of PV effect in silicon solar cells (1954 by Pearson, Chapin, and Fuller at AT&T Bell Labs)

*DOE/NREL, NASA/Smithsonian Institution/  
Lockheed Corp.*

PV: satellite and spacecraft since 1958 for power generation.

PV panels and small refrigerators

# PV Effect

Light (= **photon**) interacts with a material surface, the electrons present in the valence band of the metallic atom absorb energy and, being excited, jump to conduction band and become free.

The "**photovoltaic effect**" is the basic physical process through which a solar cell converts sunlight into electricity. Discovered by a French experimental physicist (*Edmund Becquerel*; "*La Lumière, ses causes et ses effets*") in 1839 when he was 20. Becquerel found that certain materials would produce small amounts of electric current when exposed to light.

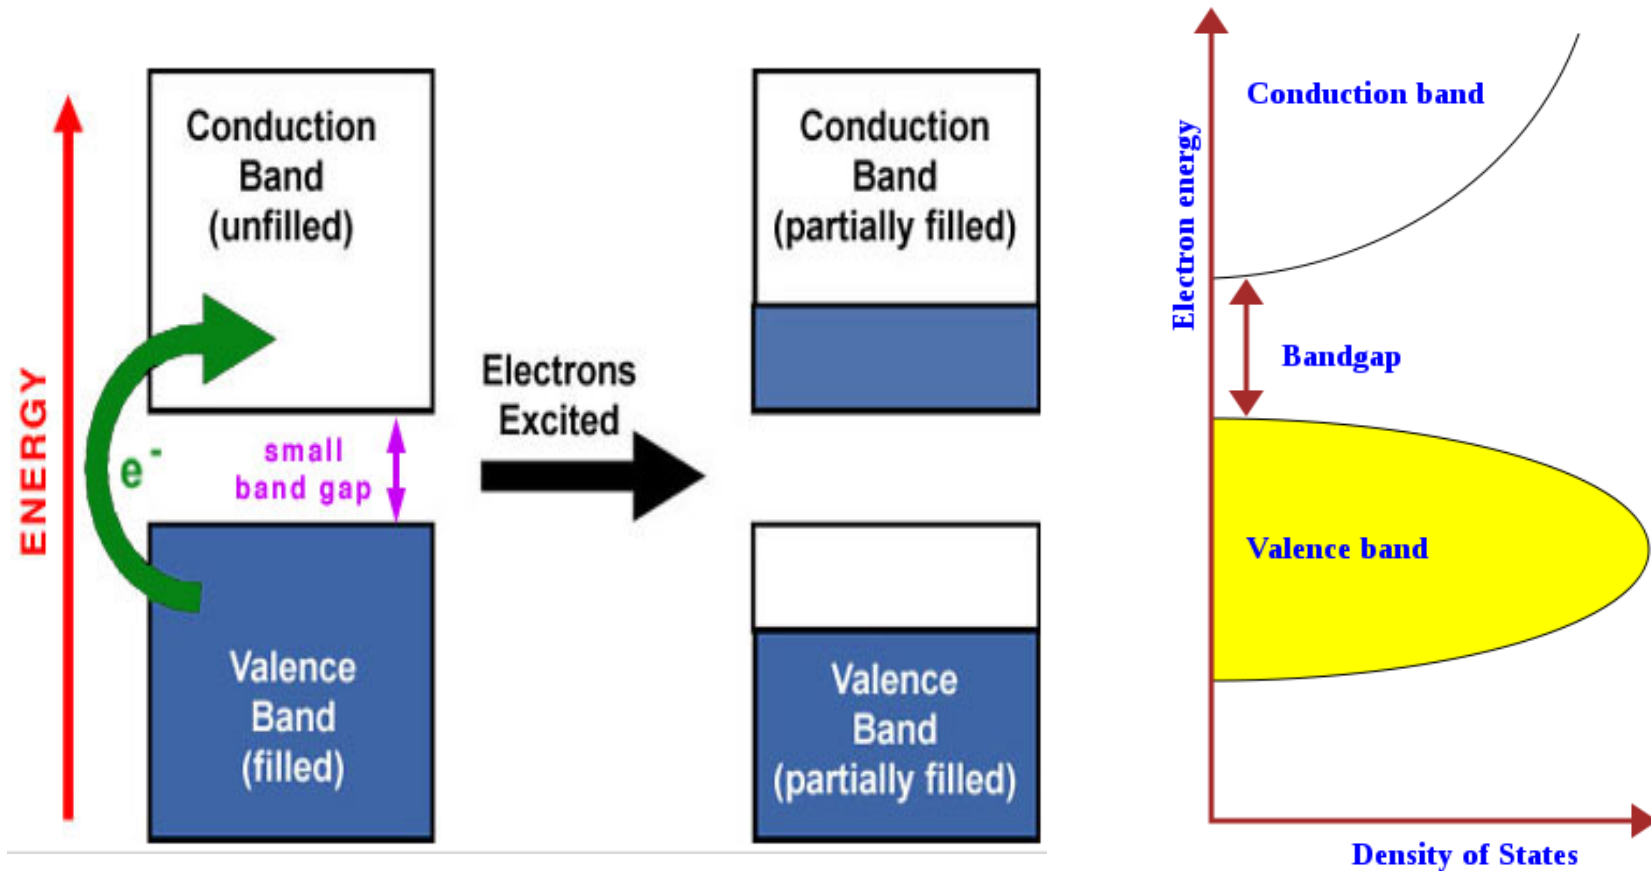

When photons strike a **solar cell**.. may be reflected or absorbed, or they may pass right through. When a photon is absorbed, the energy of the photon is transferred to an electron in an atom of the cell (***which is actually a semiconductor***).

**NOTE:** **Photovoltaic effect** differs from **Photoelectric effect** in that electrons are transferred between different bands (i.e., from the valence to conduction bands within the material).

# The concept of energy bands in metals/solids

In a solid, the valence band is the highest range of electron energies in which electrons are bound to atoms....

***The Fermi level is a hypothetical level of potential energy for an electron inside a crystalline solid***

## Some background .....

In metals...electrical resistance is the result of electrons scattering. From translation symmetry to impurities, to lattice vibrations...

The interesting fact is...**In a superconductor material, there is a “critical temperature” where there is no “resistance”**. Electrons able to move through the lattice between positively-charged atoms/ions. A lattice distortion occurs causing a second electron to move in behind it (**Cooper pairs**).

electrons coupling...depicted in a Feynman diagram

Bardeen, Cooper and Schrieffer (BCS Theory)

The two electrons form a weak attraction.  
Ability to travel in a pair encountering less resistance.

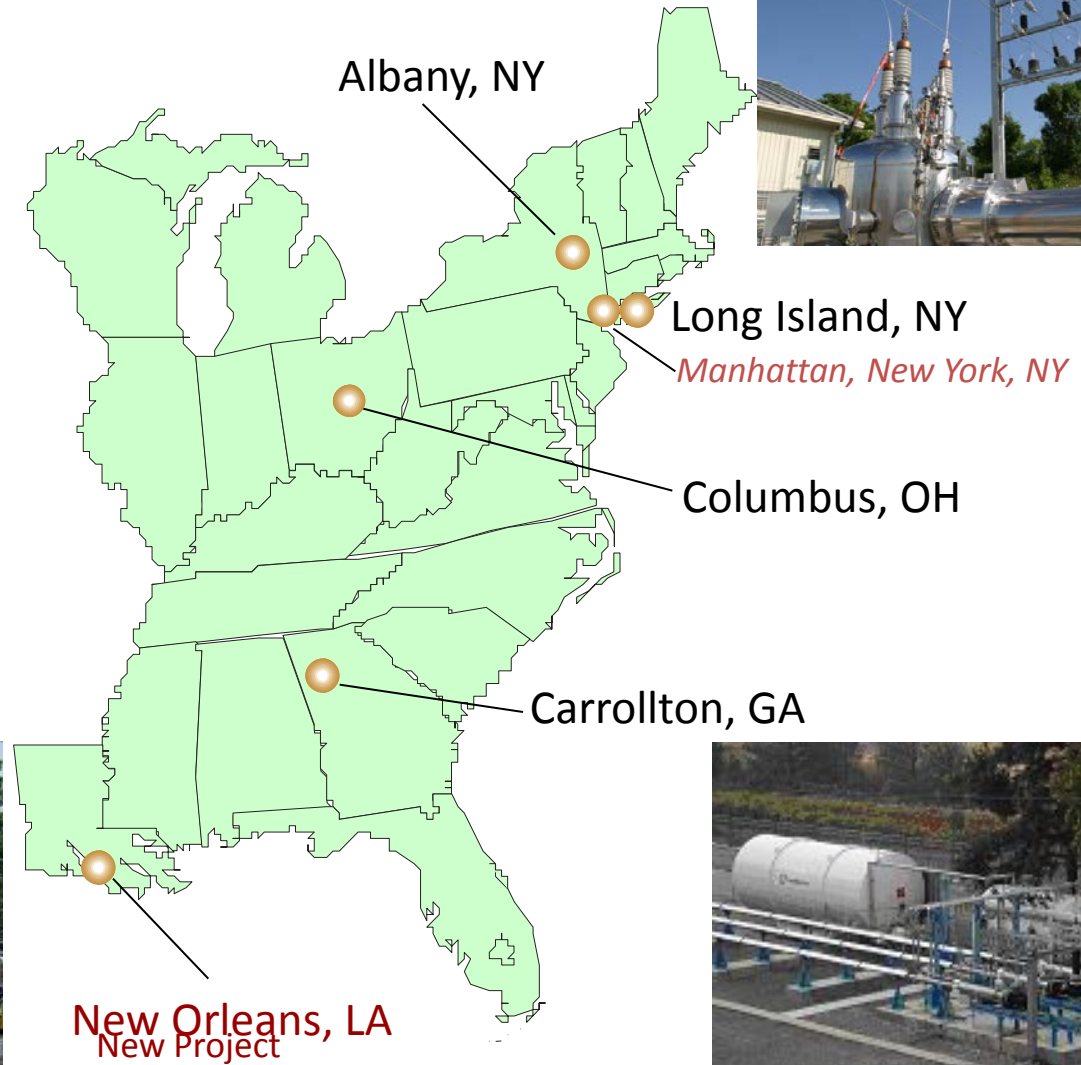

Superconductor: electron pairs (Cooper pairs) are timely forming, breaking, and forming again. The current is carried then by electrons moving in Cooper pairs ( **a Quantum effect** ).

Research: Combination of Hard Work, Dedication, and Continuing Investment....and takes time too

# U.S. HTS Cable Installations

# High Temperature Superconducting Cables

## *HTS Cable Installation Summer 2006 Long Island Power Authority (LIPA)*

### **Benefits of HTS:**

- Lower voltage operation
- No electromagnetic field
- Visually unobtrusive and saves real estate
- Reduces eminent domain issues
- Reduces exposure to elements and willful destruction

# Challenging and lots of opportunities:

- New Materials Research
  - From discovery
  - To functionality
  - Modeling
  - And characterization

# Experimental tools..

- “looking” into and designing functionality
  - Building new materials
  - The “right” tools...

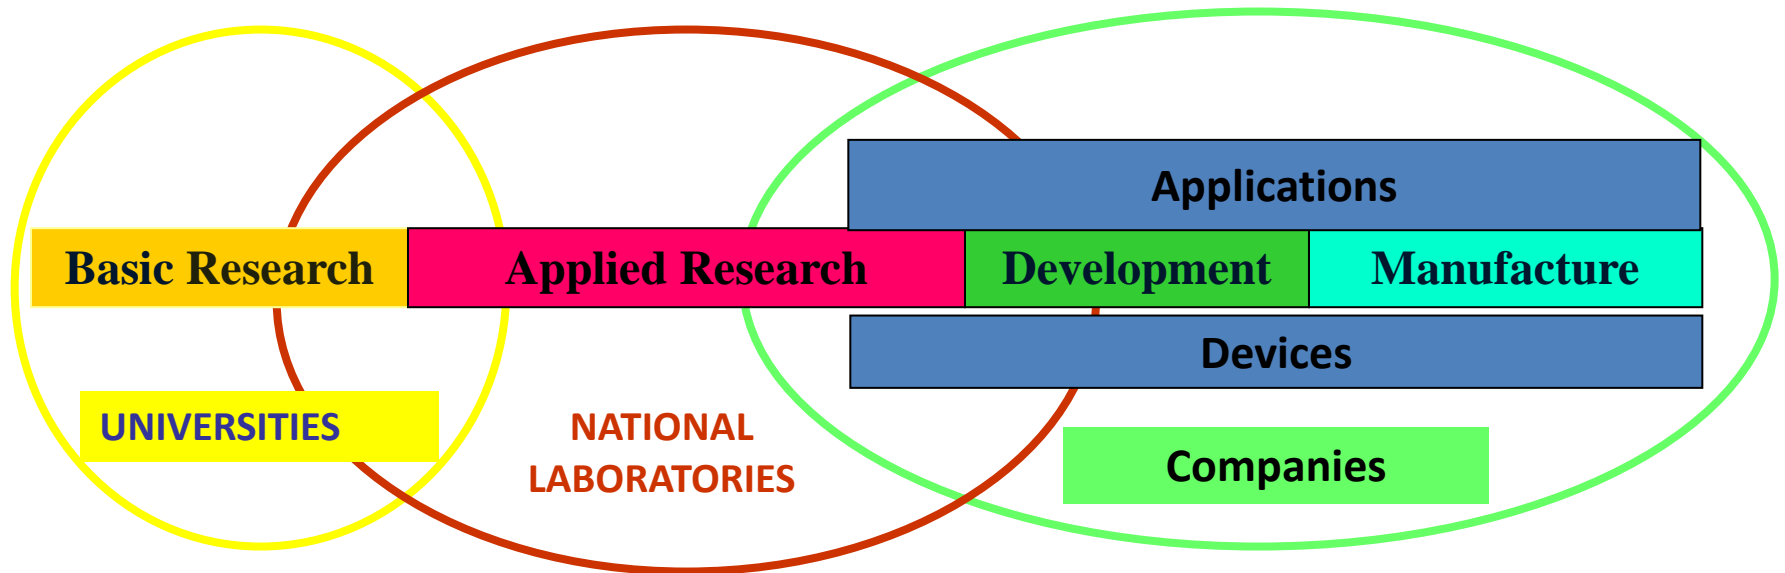

However, remember....Different experimental approaches provide different views of the same “reality”

# Interaction of Radiation with Matter

Neutron scattering as an experimental technique: Crystallography, Physics, Chemistry, Biophysics, and Materials Research in general.

Neutron experiments: Elastic scattering (diffraction) structure studies; Inelastic scattering is used for atomic vibrations and excitations in general determinations .

Neutrons: A modern experimental tool to understand materials properties on the atomic scale

# Neutron Production

## Fission:

Slow Neutron

$^{235}\text{U}$  nucleus

Fission  
Fragments

Fast Neutrons are slowed  
by collisions in the  
moderator ( $\text{C}$ ,  $\text{H}_2\text{O}$ ,  $\text{D}_2\text{O}$ )

## Spallation:

Fast proton

Heavy nucleus ( $\text{Ta}$ ,  $\text{U}$ ,  $\text{Hg}$ )

Fast Neutrons are slowed  
by collisions in a moderator  
( $\text{CH}_4$ ,  $\text{H}_2\text{O}$ ,  $\text{D}_2\text{O}$ )

# NEUTRON SOURCES – STEADY STATE (REACTORS) AND PULSED (SPALLATION)

## • REACTOR

- Fission of  $U^{235}$  produces neutrons
- Fission spectrum moderated (slowed down) by either  $D_2O$  or  $H_2O$  (less good moderator) and neutrons are extracted through beam tubes for spectrometers – fixed wavelength used

## • SPALLATION

- High Energy protons (e.g., 800 MeV) impinge on target (W, Hg or U)
- Nucleus of target is raised to excited state and subsequent decay produces neutrons.
- Neutrons moderated by liquid H,  $H_2O$  or methane
- Spallation sources generally operate in pulse mode – 20 Hz at LANSCE, 60 Hz at new SNS

Time of flight is used to sort out wavelengths

# SPALLATION & TIME-OF-FLIGHT PRINCIPLES

- 800 MeV protons hit tungsten target
- Spallation process  $\Rightarrow$   $\sim 20$  neutrons per spallation process
- Neutrons are moderated (slowed down) in  $\text{H}_2\text{O}$
- Neutron energies between meV to 100 keV available
- Bragg diffraction:  $\sim 25$  meV,  $v \approx 3000$  m/s
- $\lambda = h/mv \Rightarrow d = (h/2mL\sin\theta) \times t$
- $h$ ,  $m$ ,  $L$ ,  $\sin\theta$  are constant (detectors don't move!)
- Flight paths  $L$  between 9 and 60 meter
- Constant diffractions angle simplifies design of sample environments

# Why are we here: fundamental forces

**Classical Mechanics**

(big and slow:  
everyday experience)

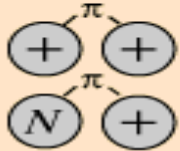

**Quantum Mechanics**

(small: particles, waves)

**Special relativity**  
(fast: light, fast particles)

**Quantum field theory**  
(small and fast: quarks)

## Fundamental Forces

<b>Strong</b>		Force which holds nucleus together	Strength <b>1</b>	Range (m) $10^{-15}$ (diameter of a medium sized nucleus)	Particle gluons, $\pi$ (nucleons)
<b>Electro-magnetic</b>			Strength $\frac{1}{137}$	Range (m) Infinite	Particle photon mass = 0 spin = 1
<b>Weak</b>		neutrino interaction induces beta decay	Strength $10^{-6}$	Range (m) $10^{-18}$ (0.1% of the diameter of a proton)	Particle Intermediate vector bosons $W^+$ , $W^-$ , $Z_0$ , mass > 80 GeV spin = 1
<b>Gravity</b>			Strength $6 \times 10^{-39}$	Range (m) Infinite	Particle graviton ? mass = 0 spin = 2

# Why Use Neutrons?

A rose in a lead container used for transporting radioactive materials. To the right is a neutron radiography image. The neutrons readily penetrate the lead container, and the hydrogen in the rose provides sufficient contrast to see even the leaves of the flower.

# But, but, but....

- We don't take pictures of atoms!

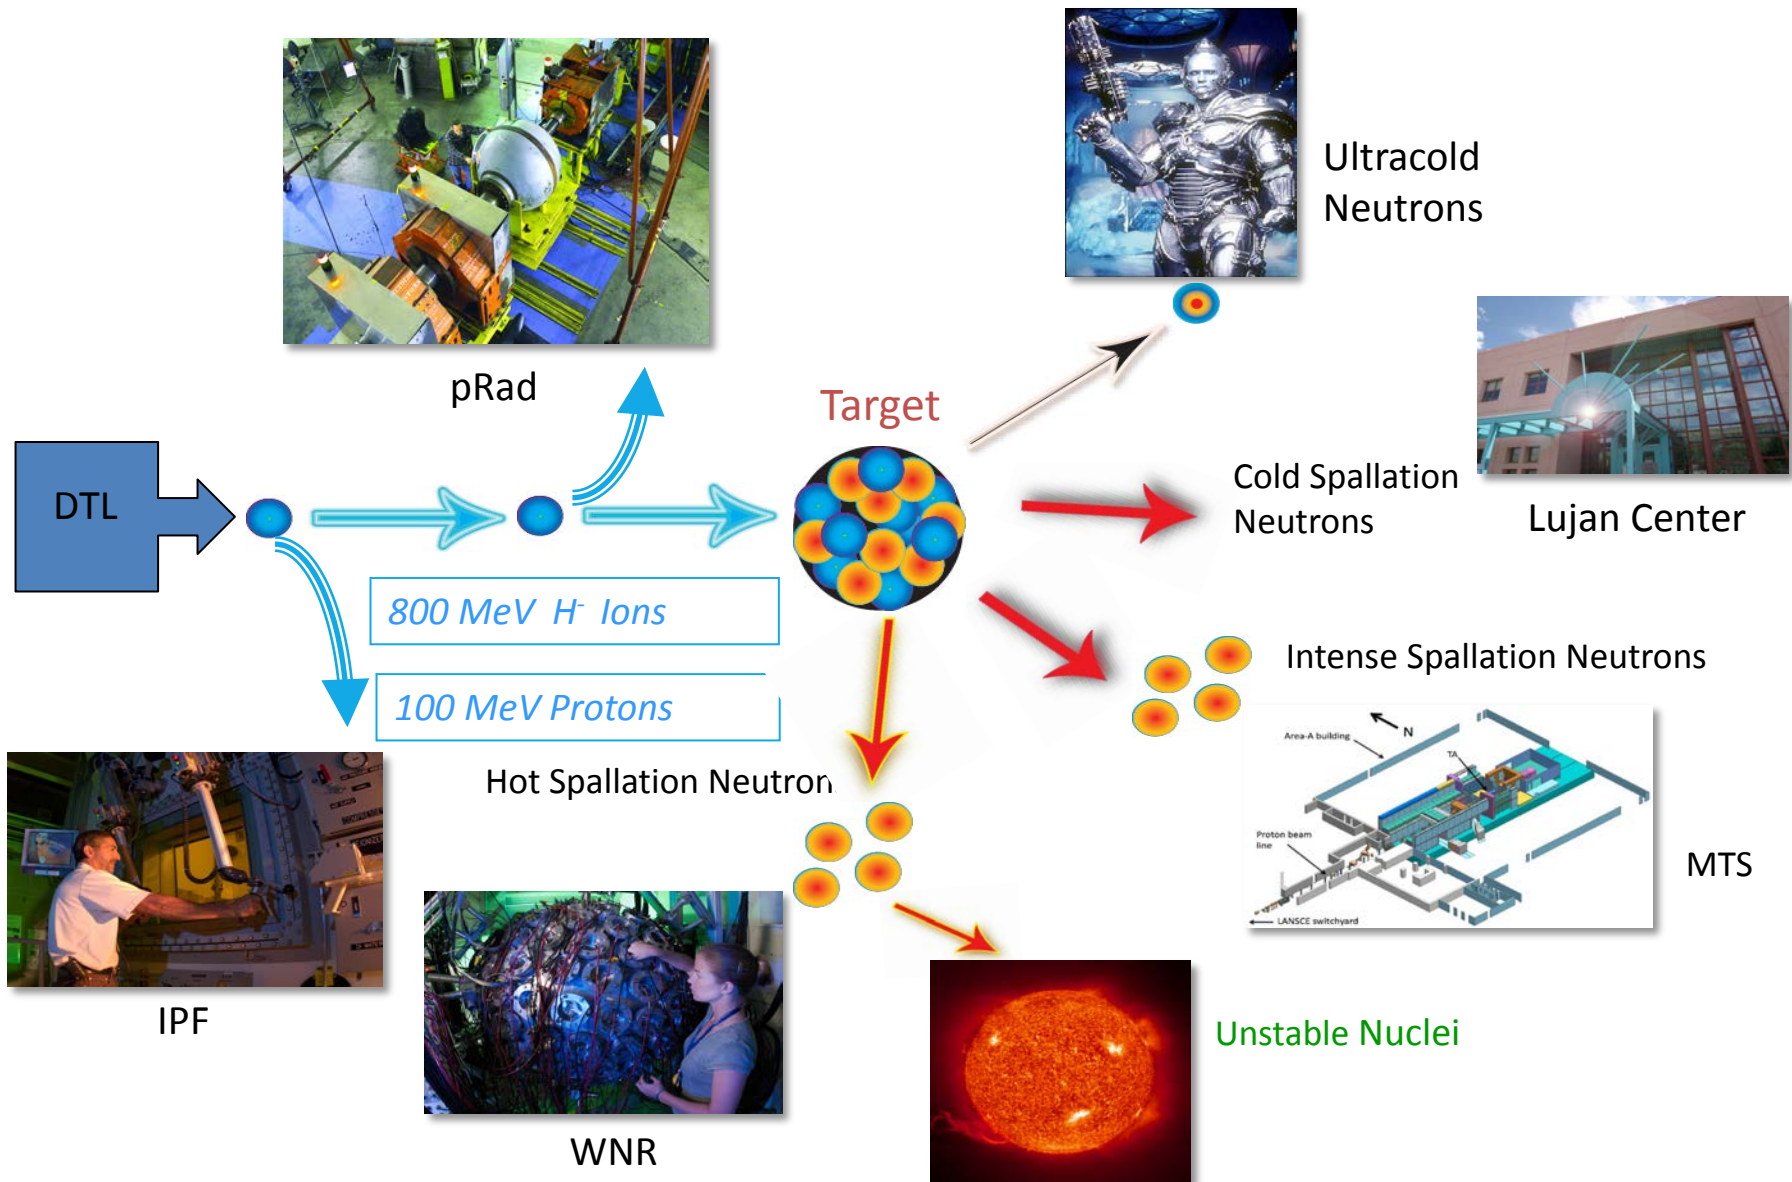

Atoms in fcc crystal

Via Analysis

- We live in *reciprocal space*

Scientists and engineers use energetic Neutrons/Protons to study matter from the subatomic to the macromolecular under normal to extreme conditions

## Industrial Partnership: LANSCE SEU Beam Line

The high-energy neutron source at LANSCE provides beams of neutrons for accelerated neutron testing of semiconductor devices. Our neutron beam reproduces the naturally occurring neutron energy spectrum seen by aircraft electronics in flight, but at one million times the intensity.

High Altitude - Atmospheric Radiation

Here

A Single Event Upset (SEU) is a change of state caused by ions striking a sensitive node in a micro-electronic device. Failures from neutron SEU are equal to all other failure modes combined
